Vacuum Circuit Breaker

VCB

Vacuum Circuit Breaker

Ensuring excellent switching capability and high quality with various advantages

Retaining the high dielectric strength with the interrupter of the high vacuum degree of 10^{-7} mbar.

Providing reliable mechanical performance and long-life expectancy with rigid structure of motor-spring energy stored mechanism.

Having excellent breaking capability with the special contact material designed by the advanced vacuum technology.

Having rapid breaking time of 3 cycle.

Certificated by New IEC publication 62271-100 and other related standards by HYUNDAI in ISO 9001 certified facilities.

HVG

Compact structure to minimize the switchgear size

- Wide 600 mm switchgear available with small size & light weight
- Mechanical endurance of 20,000 operations
- 7.2 kV, 8~25 kA, 400~1250 A

Vacuum Circuit Breaker

B

Description and Ratings HVF Type

With rigid structure and minimized moving parts, HVF breaker operation mechanism features reduced maintenance requirements providing high reliability and long-life expectancy.

The breakers are more compactly designed in size with high performance vacuum interrupters, which are made with the special contact material and the advanced vacuum technology.

This series are certificated by New IEC publication 62271-100, ANSI C 37 and other domestic standards.

Operating Mechanism

HVF circuit breakers have motor-spring energy stored mechanisms of the rigid structure. It consists of the charging mechanism, the closing spring, the trip spring, the motor, solenoids, auxiliary switches, spring charged and on/off indicators as shown in Fig.1.

Depending on the intended protection functions, the operating mechanism can be supplemented by 2nd shunt release, under voltage release, lockout relay, cut-out switch, limit switch, electrical local closing and so on.

The released closing spring is automatically recharged by the charging motor, and capable of the operating sequences " open-close-open " which is required when unsuccessful auto-reclosing operation is attempted.

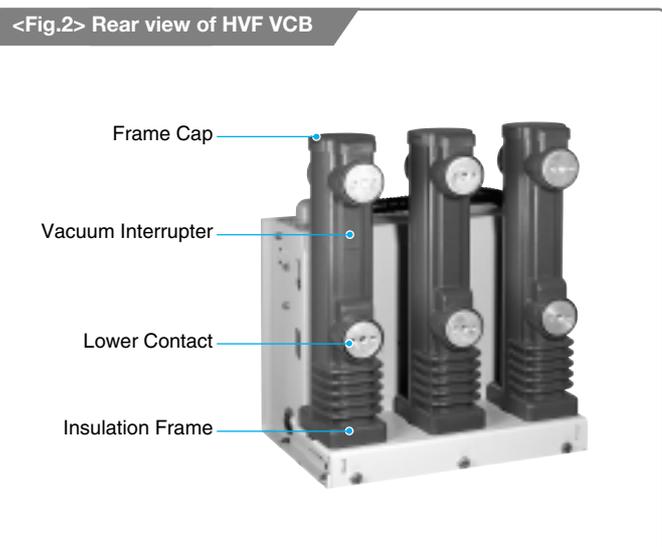

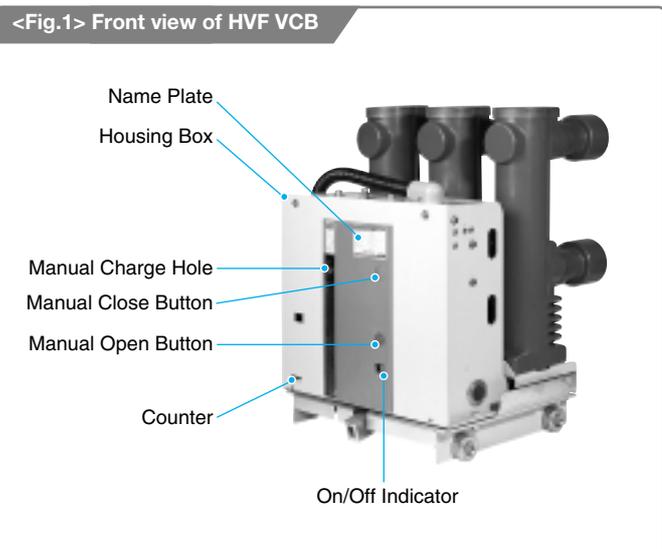

Pole Part

The pole parts are placed on the rear side of the operating mechanism. The internal side of the pole parts are well enclosed by the tubular type insulation frame as shown in Fig.2.

This prevents dust on the internal insulation material which is highly resistant to tracking.

The vacuum interrupters are mounted rigidly in the insulation frame, so withstand forces arising from switching operation and contact pressure.

In the closed state, the necessary contact pressure is established by the contact pressure spring and the atmospheric pressure. The contact pressure spring automatically compensates the arc erosion which is very small.

Description and Ratings HVG Type

HVG Vacuum circuit-breakers are very compact, so that it is possible to reduce the switchgear size and to minimize its insulation space.

This type has the compact structure, which can be easily maintained, so it requires minimized maintenance.

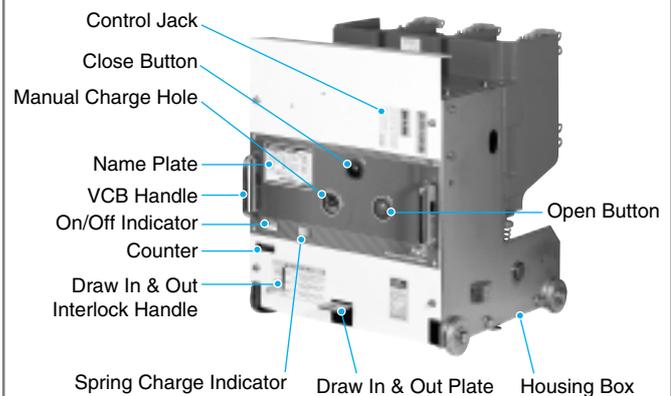

Operating Mechanism

HVG vacuum circuit breakers have the simplified motor spring energy stored mechanism which consists of the closing spring, the motor, link mechanisms solenoids, auxiliary switches and indicators as shown in Fig.3.

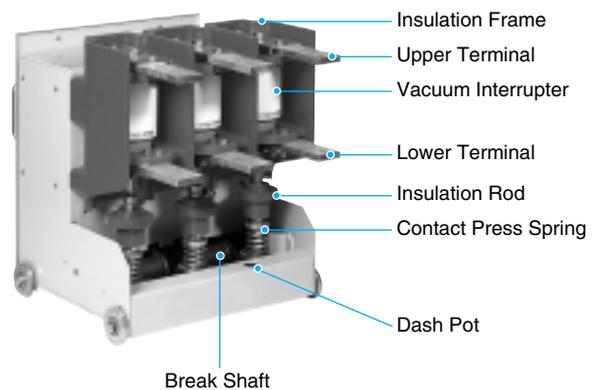

The closing spring can be charged manually or electrically, and released mechanically with the manual closing push button or electrically through the remote electrical control.

The released closing spring is automatically recharged by the charging motor, and capable of the operating sequences " open-close-open " which is required when unsuccessful auto-reclosing operation is attempted.

<Fig.3> Front view of HVG VCB

<Fig.4> Rear view of HVG VCB

Pole Part

The pole parts are mounted on the rear side of the operating mechanism in the insulation frame.

The vacuum interrupter is mounted rigidly in the insulation frame, so that it withstands forces arising from switching operation and contact pressure.

The current conducting path consists of the plug-in contacts, terminals, the vacuum interrupter and the flexible terminal.

Type of Mounting

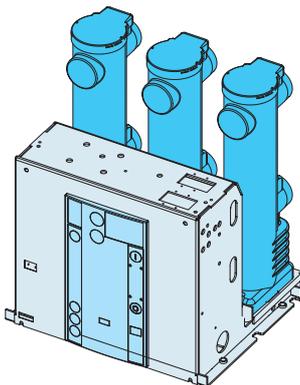

As the standard version, the fixed type and three kinds of withdrawable type circuit breaker can be provided on request.

The draw-out type breakers consist of truck, mechanical interlock, control terminal, and various accessories.

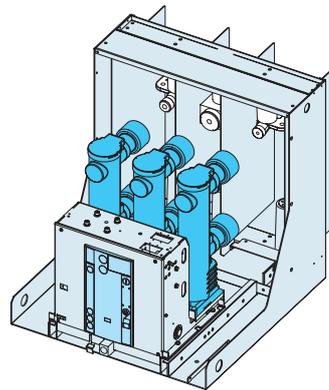

XA Type	Fixed type VCB without cradle
ES Cradle	Draw-out type VCB with E type cradle (Without shutter)
FS Cradle	Draw-out type VCB with F type cradle (Nonmetallic partition with shutter)
GS Cradle	Draw-out type VCB with G type cradle (Metallic partition & bushing with shutter)

Besides the standard version of draw-out circuit breakers, specially designed breakers like those for are available on request, such as ANSI standards or retrofit.

<Fig.7> FS Cradle (HVF VCB)

<Fig.8> GS Cradle (HVF VCB)

Technical Data Application

Applicable Standards

HYUNDAI vacuum circuit breakers meet IEC 62271-100, IEC 60056, and ANSI 37.09.

Rapid Load Transfer & Operating Duty

With its consistent short closing and operating times, Hyundai vacuum circuit breakers are especially beneficial in load transfer from one circuit to another without interruption of service.

This high speed operation performs synchronizing of the systems to be paralleled at the instant of contact closure as well. According to the relevant standards and breaker types, tests were carried out for the following operating duties.

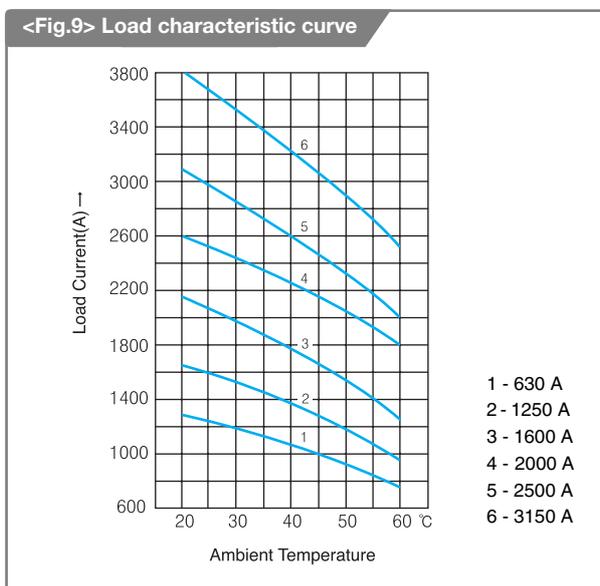

CO - 15 sec - CO
 O - 0.3 sec - CO - 3 min - CO
 O - 15 sec - CO - 3 min - CO
 (O : Open, C : Close)

Current Carrying Capacity

HYUNDAI vacuum circuit breakers may be operated at ambient temperatures between -25 and $+40$. The rated normal currents determined according to IEC standards at an ambient temperature of 40 .

When the breakers are operated at different temperature, the correction on operating current must be considered. Fig.9 shows appropriate operating currents at different ambient temperature.

However, the diagram applies only to open type switchgear, so metal enclosed switchgear load currents shall be reduced accordingly.

Switching of Overload Transmission Lines and Cables

The relatively small capacitive currents of overhead transmission lines and cables at under no load condition can be safely interrupted without restrike and overvoltage development.

Switching of Capacitors

HYUNDAI vacuum circuit breakers are the solution for capacitive applications by switching the circuit without restrike and over voltage. VCB above 7.2 kV 20 kA can switch ON/OFF up to 400 A capacitive load, and higher than 400 A circuit shall be informed in advance.

Switching Unloaded Transformer

By the special contact materials, the chopping current of the vacuum circuit breakers is only 4 to 5 A, so overvoltage is limited when transformers disconnected at no load condition.

Switching of Motors

Long electrical lifetime at rated current lets HYUNDAI vacuum circuit breakers be the excellent solution for high voltage motors.

Surge absorber is recommended on these motors, which have less insulation level or less than 600 A starting current. Even though low surge occurrence is the feature of HYUNDAI vacuum circuit breakers, the motor and the circuit itself can be protected efficiently by the surge absorber.

Interruption of Transient Recovery Voltage

HYUNDAI vacuum circuit breakers can break the accident current properly at down stream of transformers, generators, and current limit chokes, whose rising rates of transient recovery voltage are higher than IEC Standard, even up to $10 \text{ kV}/\mu\text{s}$.

Arc Quenching System

A metal-vapor arc discharge in the vacuum is initiated by the current to be interrupted as the contacts open. The current flows through this metal-vapor plasma until the next zero transition.

The arc extinguishes in the vicinity of the current zero, and the conductive metal-vapor condenses within a few microseconds on the metal surfaces.

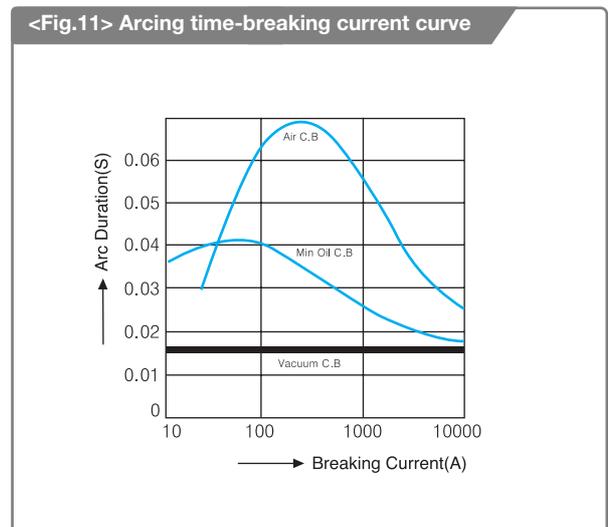

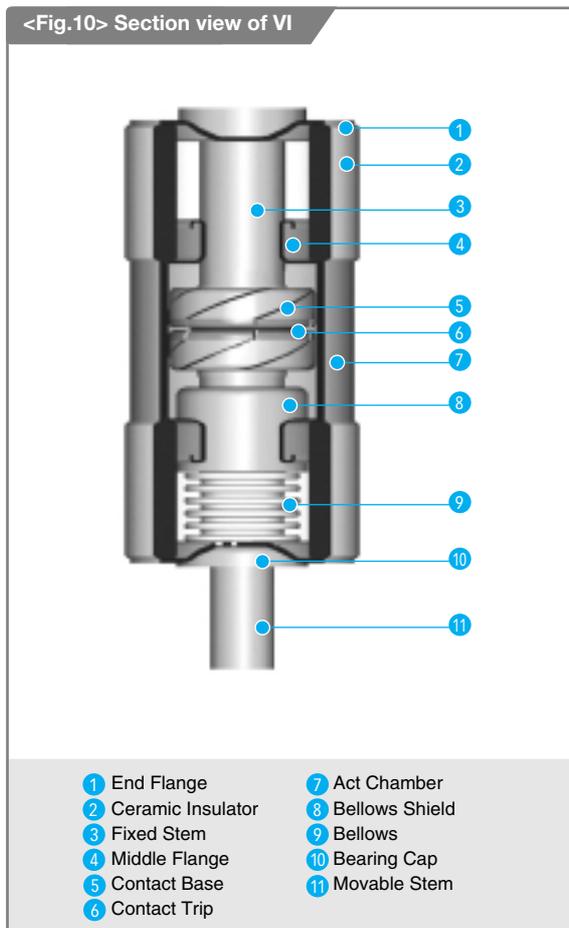

As a result, the dielectric strength in the contact gap is rapidly rebuilt.

The rapid build-up of the dielectric strength at the contact gap enables the arc to be safely extinguished even if contact separation takes place shortly before a current zero transition. The maximum arcing time for the last pole to clear is therefore only up to 15 ms.

If the metal vapor arc discharge can be maintained within a certain level, the current is supposed to be chopped prior to current zero.

This chopping current must be controlled in order to prevent build-up of unduly high overvoltages when inductive circuits are switched. The sintered CrCu contact limits the chopping current up to 4-5 A.

The geometry and size of the contact are designed differently according to breaking current and interrupter type.

<Table 1> Arc Quenching Medium

Breaker Type	Arc Voltage (V)
Vacuum Circuit Breaker	20~200
SF ₆ Gas Circuit Breaker	500~1000
Oil Circuit Breaker	1500~3000
Magnetic Blaster Circuit Breaker	1500~3000

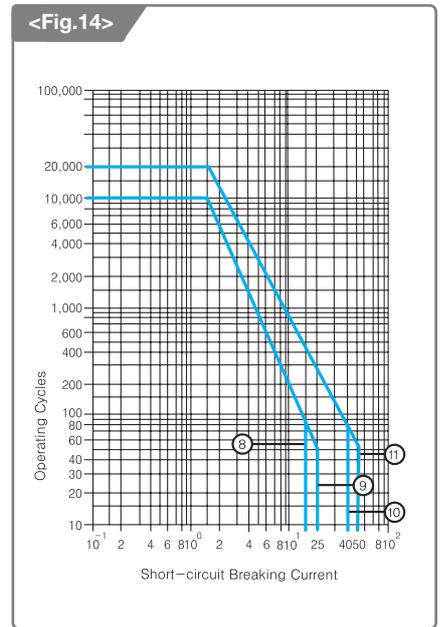

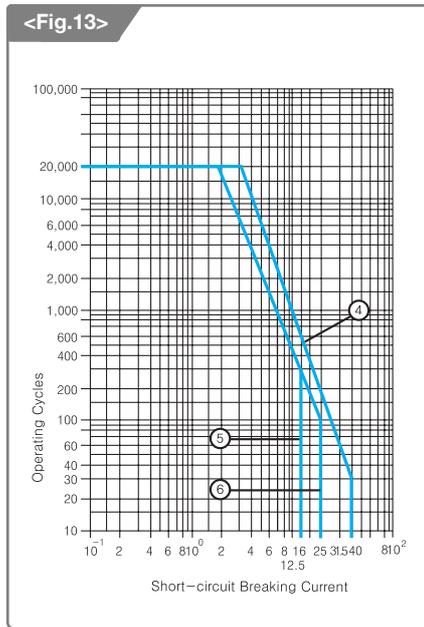

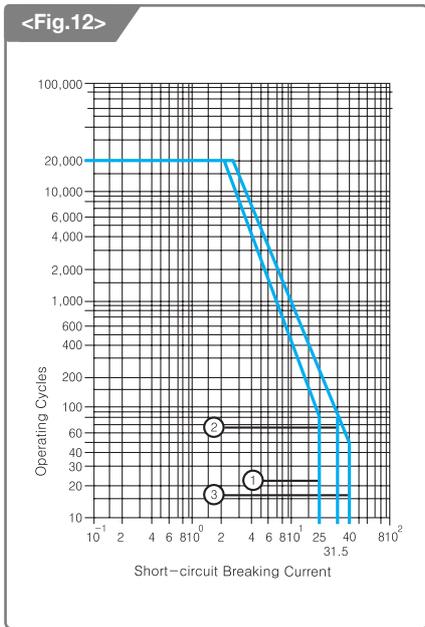

Service Life

HVF / HVG Type

HYUNDAI vacuum circuit breaker needs minimum maintenance due to the simple operating mechanism and robust construction.

Vacuum circuit breaker shall be maintained periodically to ensure the perfect performance during mechanical and/or electrical lifetime.

Please refer to the instruction manual for the detailed information.

Control & Auxiliary Circuits

Charging Motor

HYUNDAI VCB adopts short-time duty charging motor, and the specification is stipulated on Table 3.
Since the motor operating time is short, the maximum value and inrush current are disregarded.

Auxiliary Contacts

The following versions are available:

X : Without control jack

C : Single control jack leaded out from the breaker body with a 0.8 m cable, 4NO+4NC

D : Double control jack leaded out from the breaker body with two 0.8 m cables, 10NO+10NC

Rating of auxiliary contacts

Operating voltage : Max. 250 V AC, DC

Continuous thermal current : 10 A

Making current : 30 A

Switching capacity : 2 A at DC 220 V, T=20 ms

Solenoids

Closing solenoid and tripping solenoid operate latching mechanism for VCB springs, so the VCB can be controlled remotely.

The specification is mentioned on Table 3.

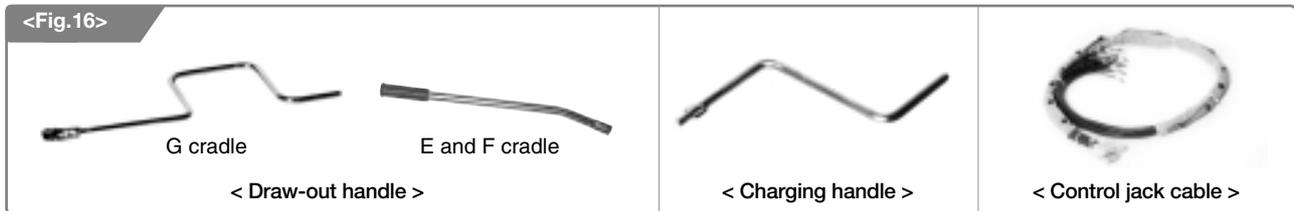

The solenoids unlatch the closing spring and opening spring to close and open the VCB, respectively.

<Table 3> Current consumption & operating voltage for motor and solenoids

Standard Accessories

HVF Type

HVG Type

Optional Accessories

2nd Shunt Release

2nd shunt releases are used to open the circuit breaker by appropriate protective relays, deliberate electrical or mechanical action. They are connected to control power (AC or DC); however, in special cases they may also be connected to voltage transformers.

Undervoltage Release (UVR)

Undervoltage release (UVR) trips the VCB automatically when the control voltage drops to 35% of rated voltage. Then, the VCB can be closed when the control voltage recovers to 85%. UVR can be connected to voltage transformer, and can be applied to DC control power. Lockout relay is recommended along with UVR to block undesirable closing attempt.

Lockout Relay

Lockout relay blocks VCB closing command when the control voltage is lower than 60% of rated voltage. VCB closing command can be carried out when the control voltage recovers to 85%. When lockout relay is installed, the VCB can be closed only when UVR is energized.

Varistor Module

Varistor module protects charging motor and solenoids from the surge of DC control system. Potential damage caused by DC surge can be limited by applying varistor module to motor and solenoids.

Condenser Trip Device (CTD)

Even though control power is lost, condenser trip device can trip the VCB of AC control system.

Order No.	HVFS-T7	HAFS-T9
Raged Input Voltage	AC 110 V	AC 220 V
Charging Voltage	DC 145V	DC 290V

Vacuum Checker

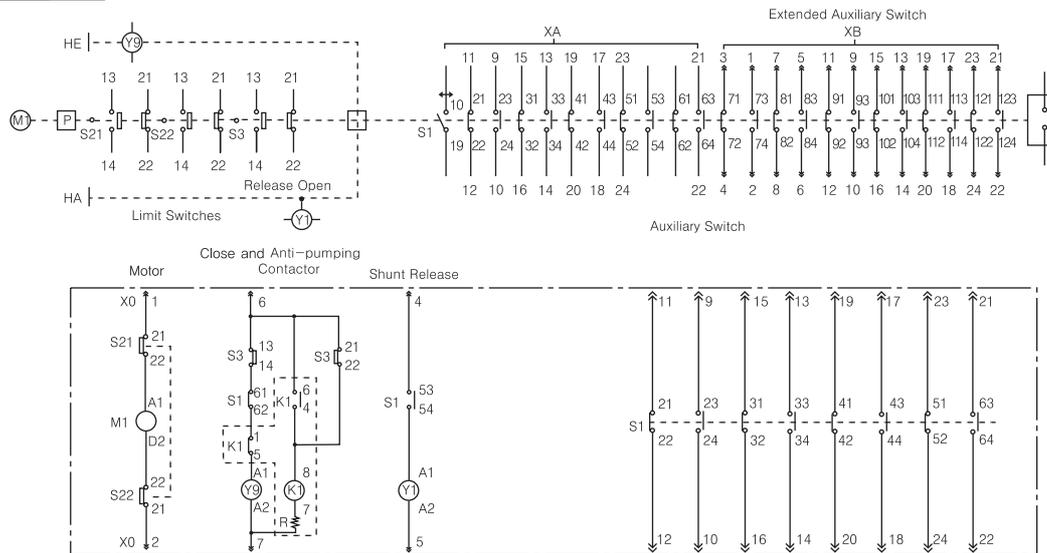

Vacuum interrupter has longer lifetime than VCB, but vacuum degree can be check for more reliable operation.
